# In[1]:
#Individual Assignment #1
#Jeremiah Nugent- MIS-310-01

#Problem 1: BMI
#Part 1: Receive input from users':

print("Calculating your personal BMI (Imperial and Metric)")

weight_pounds= float(input("Please enter your weight in pounds: "))
height_inches= float(input("Please enter your height in inches: "))

#Part 2: Process data from users' and calculate BMI :
body_mass_index= (weight_pounds / (height_inches ** 2)) * 703

weight_kilograms= weight_pounds* 0.45392
height_meters= height_inches * 0.0254

metric_bmi= weight_kilograms/ (height_meters ** 2)

#Part 3: Round decimals and print outputs:

print("\nHere are your results:")
print(f"BMI (Imperial): {body_mass_index:.2f}")
print(f"BMI (Metric): {metric_bmi:.2f}")

# In[2]:
#Problem #2- Vehicle Routing
#Part 1: Receive travel input from users':

travel_time_minutes= float(input("Please enter your travel time in minutes: "))
travel_speed_mph= float(input("Please enter the average speed (in MPH) during your travel time: "))

#Part 2: Compute data from users' data:

travel_time_hours= travel_time_minutes / 60
travel_distance_miles= travel_time_hours * travel_speed_mph

#Part 3: Print results from calculations:

print(f"\nResults:")
print(f"Your travel distance was: {travel_distance_miles:.2f} miles.")

# In[3]:
#Results from Problem 2:
#Local route result: 30 miles.
#Parkway route result: 35.20 miles.
#Highway route result: 47.85 miles
#Therefore, the shortest route distance is the Highway route due to the higher amount of travel miles possible.
